CLASS I AND II RESTORATIONS

A FULL GUIDE

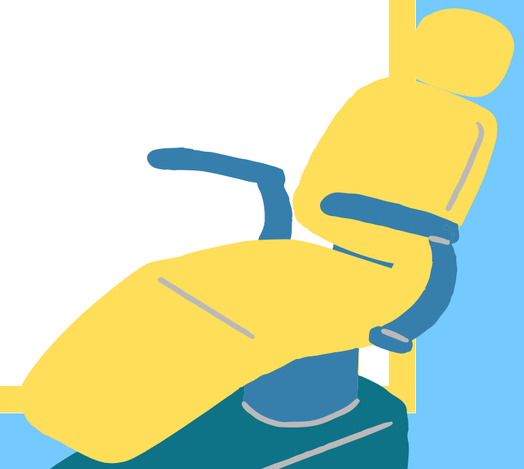

INTRODUCTION

Class I and II restorations are an essential part of the workflow in everyday dentistry.
That is why it is of utmost imporatnce to master the skill of carrying out quick, precise and predictable restorations.

In this presentation, we will discuss the principles and clinical steps of restoring Class I and II cavities with composite focusing on achieving proper:

- Function
- Anatomy
- Contact
- Esthetics

What You Need for the Perfect Restoration

Micromotor

Low speed contra

Ball Burnisher

Composite

Matrix band

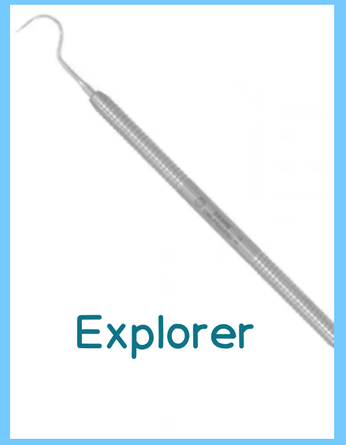

Lightcure

Plastic Instrument

Acorn burnisher

Explorer

Microbrush

Wedges

Polishing kit

Finishing Discs

Stones

Isolation

In a clinical setting, proper isolation is key to a succsessful restoration.

Composite restorations are **especially hydrophobic (ie sensitive to moisture)**. So your working field should be isolated properly from moisture in the oral cavity like saliva and blood.

Isolation can be done using several methods depending on each case.

Rubber Dam isolation is considered the **GOLDEN STANDARD** of isolation.

However, in some cases, rubber dam application is not possible .

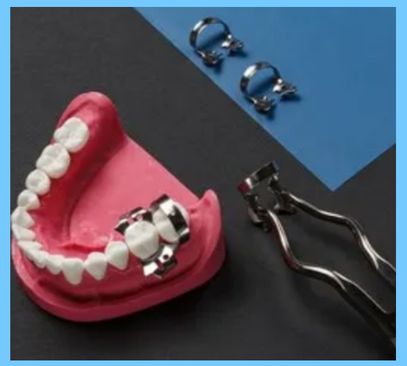

Alternatives to rubber dam can be :

- Cotton roll isolation
- Isolite system
- Combination of bite blocks, high volume suction, cheeck retractors.

CLASS I RESTORATION

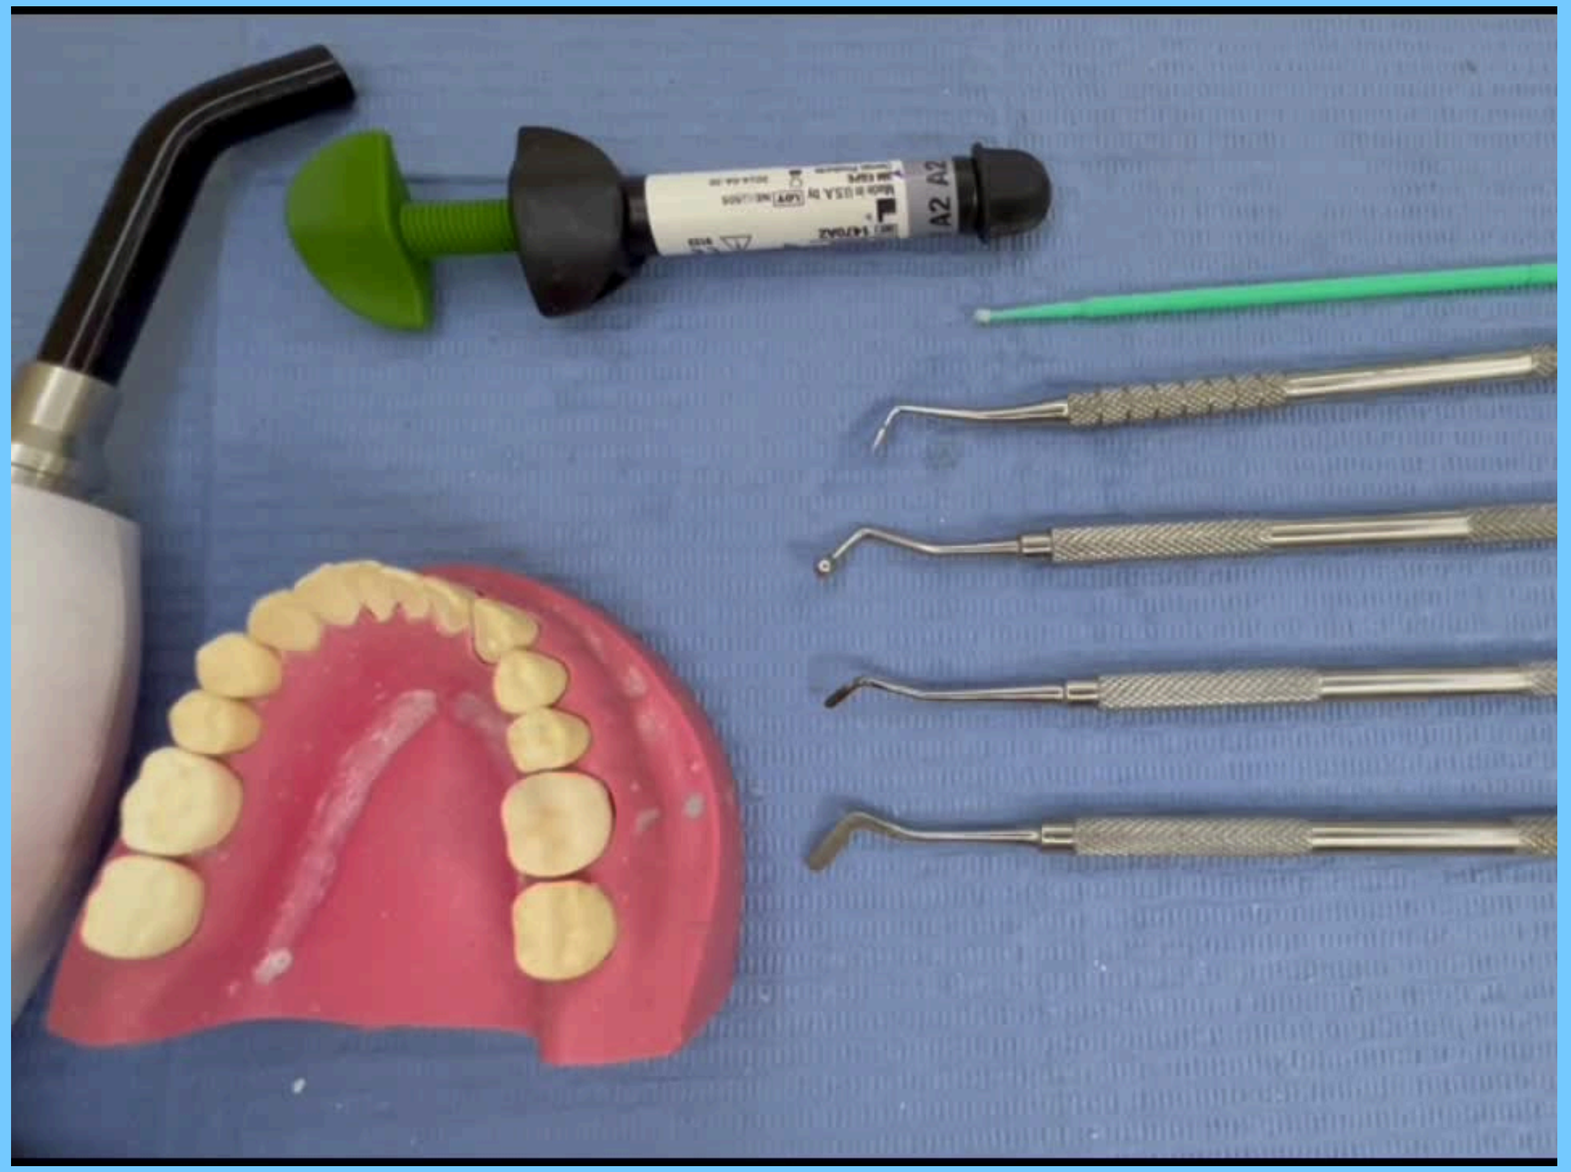

In cases where the carious lesion is confined to only the occlussal surface of the tooth, a class I cavity followed by a class I composite restoration is carried out.

In this scenario, your main focus should be:

- Layering composite properly to prevent shrinkage stresses.
- Achieving proper marginal seal to prevent reccurrent caries at the margin.
- Restoring proper cuspal anatomy to regain function.
- Restoring occlusion.

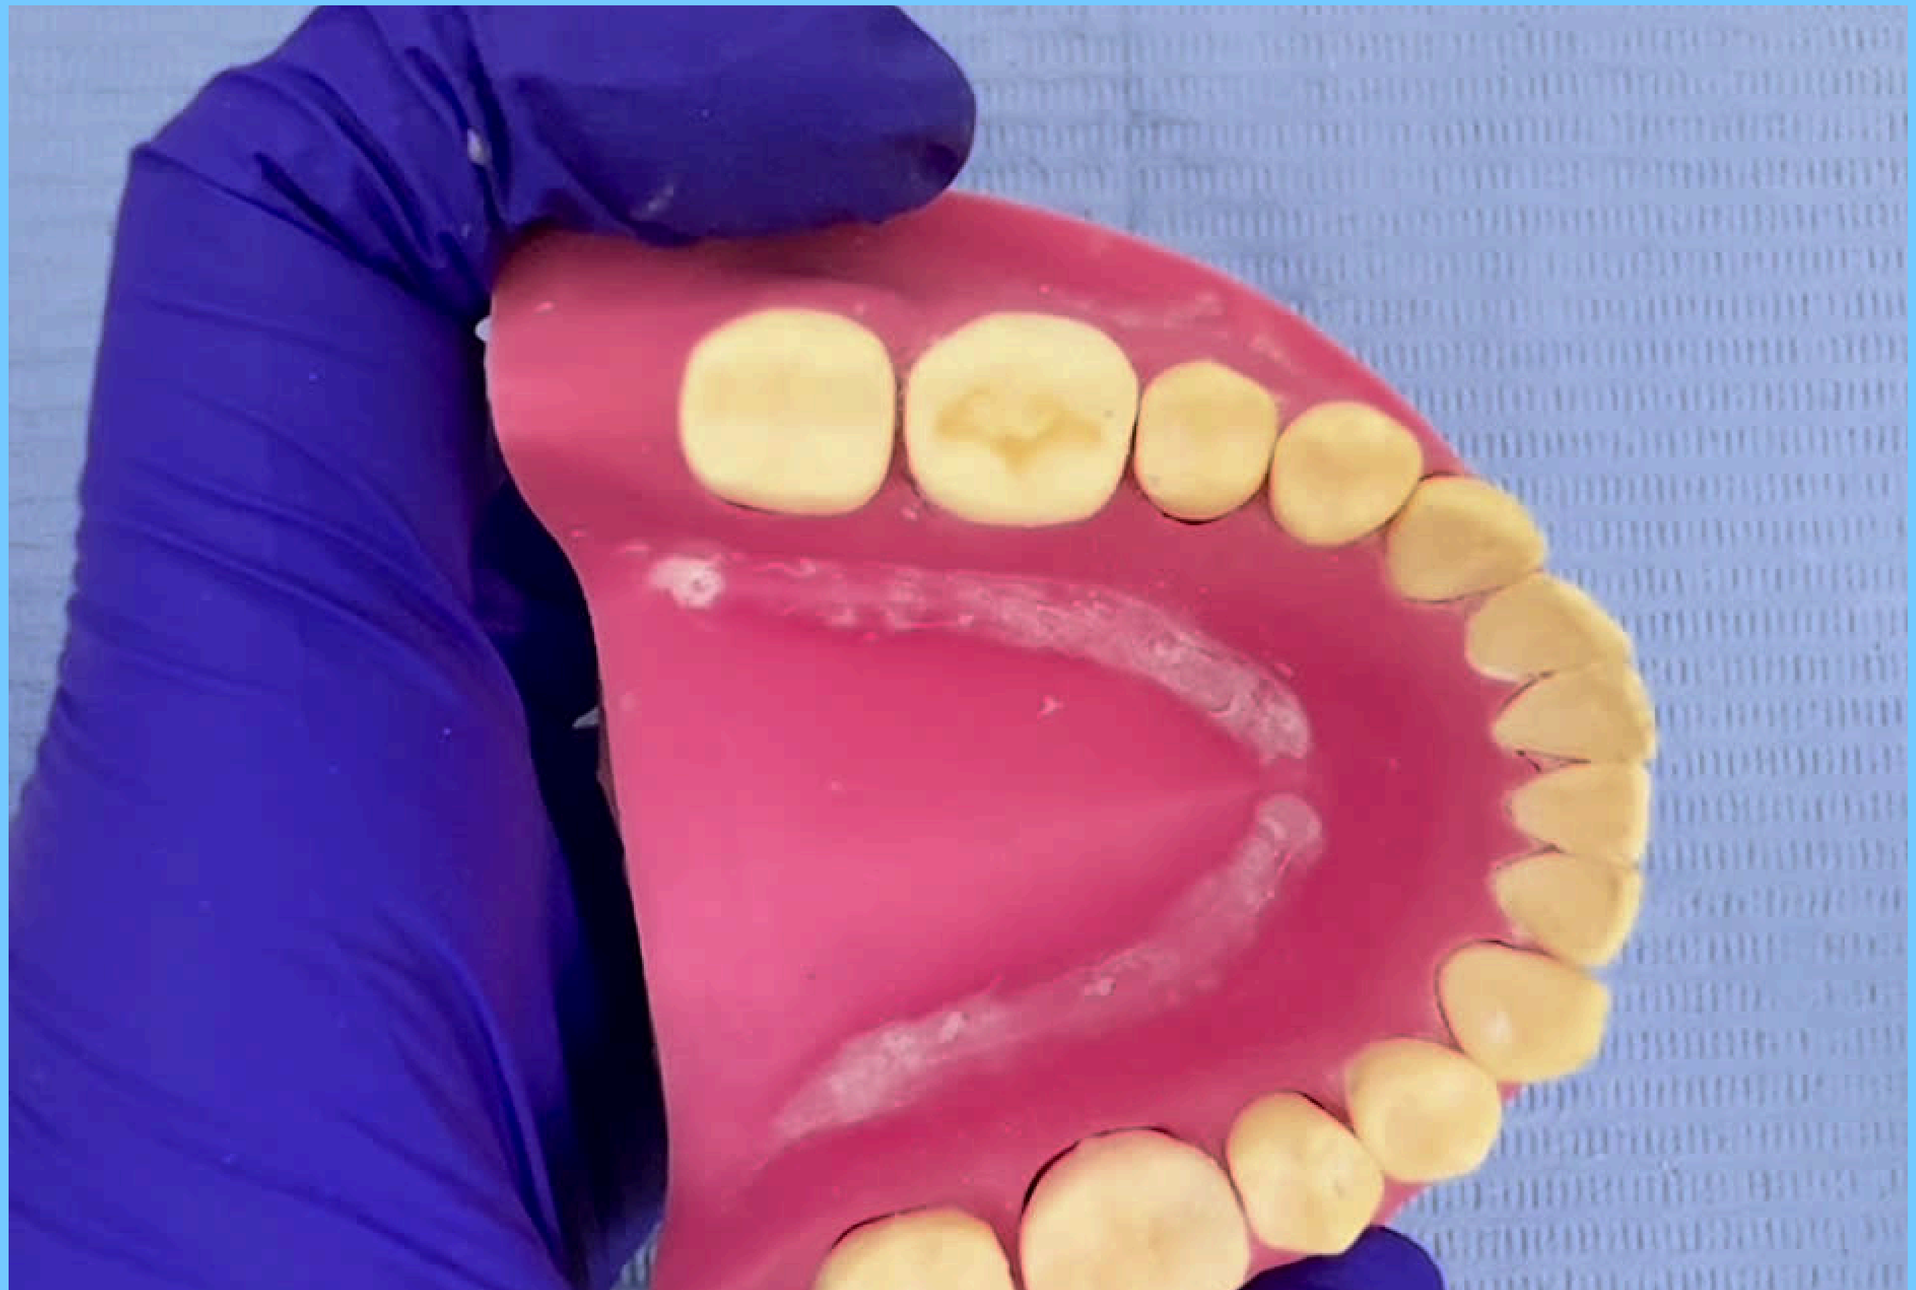

CLASS I RESTORATION

CLASS II RESTORATIONS

Usually in clinical settings, class II cavities do not occur isolated only on the proximal surface. They are usually found in the form of occlusal+ proximal caries.
In this case, the quality of the cavity you make is just as important as the quality of the composite restoration.(see cavity criteria in cavity presentation).

Your approach should be as follows:

- First,choose the proper type and size of matrix band and wedge. This will help in restoring contact which is of the utmost importance in class II cavities.

- After ensuring your marginal seal, build the proximal wall and then remove the matrix band.

You have now transformed your cavity into a simple class I.

- Now you can easily restore occlusal anatomy.

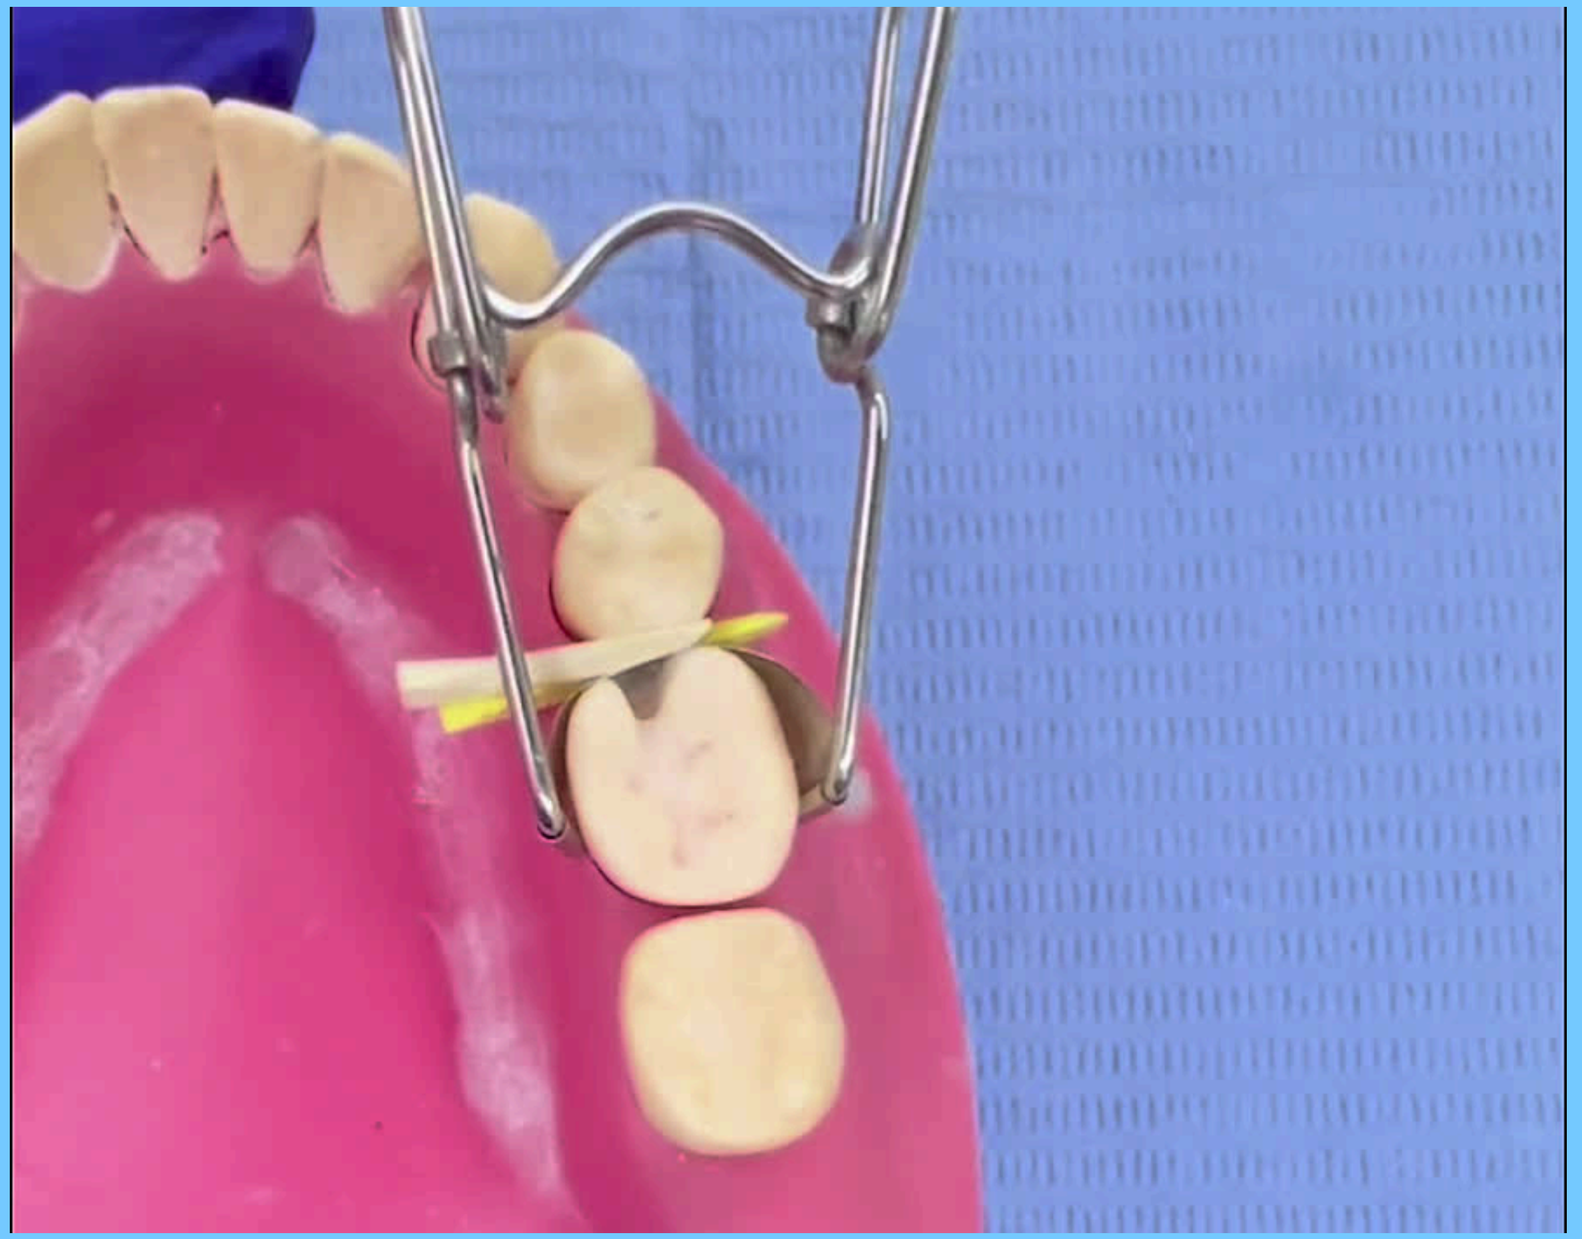

- Finishing and polishing.

FINISHING YOUR RESTORATION

We promise you after this step, your'e really done!

Let's talk about finishing your restoration.
This step is often skipped by students thinking that it does not matter. Let us tell you why it does matter:

- Removing any roughness on the restoration that could lead to food accumilation if left unfinished.

- Refining the anatomy and contour of the restoration.

- Remove excess composite.

- Improve esthetics and enhance surface luster.

<u>Conclusion:</u> Do NOT skip finishing if you want that A+ restoration!

FINISHING YOUR RESTORATION-

FINISHING YOUR RESTORATION-

CLASS II

HOW TO CHECK YOUR WORK?

Check that occlusal anatomy and contact is properly restored.	check that your restoration is properly finished and polished and there is no roughness.
Check using explorer that there is no excess composite	
Using probe, check that your restoration has sealed all margins.	
Check that the restoration restored the natural contour of the tooth.
